Lescano, Waylon Chester M.

1. Because View handles the layout and appearance while Text handles the text itself. Putting a plain text inside View without Text throws out an error.
2. What flex-1 does is it makes the component take up the space available and enables the flex mode.
3. Div = View
   P = Text
   Img = Image
   Button = Pressable
4. global.css is the Tailwind stylesheet entry point; tailwind.config.js tells Tailwind which files to scan and loads the NativeWind preset.
5. Pressable has flexible styling options while Button does not.
6. Flex-row changes the direction of the children horizontally, View defaults to a column layout, stacking children vertically.
7. We need an onPress handler to make the buttons functionable
8. Because they are React Native components.
9. For organization reasons, to make coding clean.
